3739

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 April 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17 and 20-46 is/are pending in the application.
- 4a) Of the above claim(s) 3,5-7,9,10,13-16,25-30,36,39 and 42 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,2,4,8,11,12,17,20-24,31-35,37,38,40,41 and 43-46 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 16 November 2006 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☐ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date 4/26/07.
- ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- ☐ Notice of Informal Patent Application (PTO-152)
- ☐ Other: _____.

Art Unit: 3739

DETAILED ACTION

Response to Amendment

This Office Action is in response to applicant's Request for Continued Examination filed on April 26, 2007. The double patenting rejections are maintained on the record. All previous prior art rejections are withdrawn in view of applicant's amendments.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claim 17 is provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claim 1 of copending Application No. 10/999230. Although the conflicting claims are not identical, they are not patentably

distinct from each other because both claims specify: a shaft, a flexible portion, and a head coupled to the shaft through the flexible portion and pivotably coupled to the flexible portion, the head including a non-conductive surface and an electrically conductive surface, wherein the flexible portion is configured to bias the non-conductive surface and the electrically conductive surface towards a tissue surface.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim 17 is provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claim 3 of copending Application No. 10/999230. Although the conflicting claims are not identical, they are not patentably distinct from each other because both claims specify: a shaft, a flexible portion, and a head coupled to the shaft through the flexible portion and pivotably coupled to the flexible portion, the head including a non-conductive surface and an electrically conductive surface, wherein the flexible portion is configured to bias the non-conductive surface and the electrically conductive surface towards a tissue surface. Furthermore, it would be obvious, if not inherent, for the non-conductive surface of 10/766894 to be adjacent at least a portion of the electrically conductive portion, since the non-conductive portion limits penetration of the electrically conductive surface into the tissue surface.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim 18 is provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 2 and 12 of copending Application No. 10/999230. Although the conflicting claims are not identical, they are not patentably distinct from each other because both claims specify: a shaft, a flexible portion, and a head coupled to the shaft through the flexible portion, the head being pivotably coupled to the flexible portion, the head including a substantially planar tissue contact surface including a non-conductive portion and an electrically conductive portion. In addition, it would be obvious and require only routine skill in the art to make a flexible portion to be resiliently flexible since such materials are well-known and widely used in the art.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim 43 is provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claim 12 of copending Application No. 10/999230. Although the conflicting claims are not identical, they are not patentably distinct from each other because both claims specify: a shaft, a resiliently flexible portion, and a head coupled to the shaft through the resiliently flexible portion, the head being pivotably coupled to the resiliently flexible portion, the head including a substantially planar tissue contact surface including a non-conductive portion and an electrically conductive portion.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claims 1-2, 4, 8, 11-12, 17-24, 31-35, 37-38, 40-41, and 43-46 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-3 and 12 of copending Application No. 10/999230. Although the conflicting claims are not identical, they are not patentably distinct from each other because the more specific claims of 10/766894 encompass the broader claims in 10/999230. In addition, the "resiliently flexible portion" and "non-conductive surface" of 10/999230 are elements that are obvious and well-known to one of ordinary skill in the art. Following the rationale in *In re Goodman* cited in the preceding paragraph, where applicant has once been granted a patent containing a claim for the specific or narrower invention, applicant may not then obtain a second patent with a claim for the generic or broader invention without first submitting an appropriate terminal disclaimer.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148

USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

Art Unit: 3739

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1, 4, 8, 11-12, 17, 20-23, 31-35, 37-38, 40-41, and 43-46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lennox (U.S. Pat. No. 5,919,191) in view of Irion (U.S. Pat. No. 6,251,108 B1) and further in view of Grossi (U.S. Pat. No. 5,582,610).

Regarding claim 1, Lennox discloses an electrosurgical instrument comprising:
a shaft 20 (Figs. 1 and 4);
a flexible portion 46 (col. 5, ln. 61-63, col. 7, ln. 12-18, and Figs. 1 and 5-7); and
a head 14 coupled to the shaft 20 through the flexible portion 46 and pivotably coupled to the flexible portion (col. 11, ln. 13-16 and Fig. 8), the head including an electrically conductive surface (col. 5, ln. 50-60),

wherein the flexible portion 46 is configured to passively bias the electrically conductive surface towards a tissue surface (Figs. 5-7).

The claim differs from Lennox in calling for the head to include a non-conductive surface. Irion, however, teaches an analogous electrosurgical rolling head electrode 1 that includes an electrically conductive surface 11 and a non-conductive surface 12 in order to adjust a defined distribution of current density (col. 1, ln. 53 – col. 2, ln. 11 and Fig. 1b). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have provided a non-conductive surface on the head of

Lennox in view of the teaching of Irion in order to adjust a defined distribution of current density.

In addition Lennox discloses that a non-rolling sled electrode may be used instead of a roller electrode for coagulation (col. 11, ln. 11-12). Lennox further discloses that the coagulating electrode can have different shapes to vary the coagulation pattern (col. 12, ln. 29-32). The claim differs from Lennox in calling for the non-conductive surface to be substantially planar and flat. Grossi, however, teaches that it is obvious to make a sliding electrode surface substantially planar and flat (Figs. 5 and 6a-b). In addition, Irion teaches that his electrode with conductive and non-conductive surfaces can be in the shape of a plate (col. 2, ln. 40-44). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to make the sliding electrode with conductive and non-conductive surfaces of Lennox in view of Irion have a substantially planar and flat surface in view of the teaching of Grossi as an obvious shape for a sliding electrode that is known in the art.

Irion further discloses that it is well-known in the art to make an electrically conductive surface either recessed in or projecting from a surface (col. 1, ln. 8-30). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have made the electrically conductive surface of Lennox either recessed in or projecting from a non-conductive surface in view of the teaching of Irion since these constructions are well-known in the art, and it would have required only routine skill in the art. In addition, applicant has not disclosed any criticality or unexpected result associated with these limitations.

Regarding claim 4, Lennox further discloses that the flexible portion comprises a spring (col. 8, ln. 1-12 and Fig. 9).

Regarding claim 8, Lennox further discloses that the flexible portion is configured to flex in at least a direction and the head is configured to pivot about an axis substantially perpendicular to the direction (col. 11, ln. 13-16 and Figs. 8-9).

Regarding claim 11, Lennox further discloses that the head 14 includes a slot about which the head is configured to pivot (col. 11, ln. 13-16 and Figs. 1 and 8).

Regarding claim 12, Lennox further discloses that the slot is a transverse slot pivotably receiving the flexible portion (col. 11, ln. 13-16 and Figs. 1 and 8).

Regarding claim 17, Irion further discloses that the non-conductive surface 12 is arranged relative to the electrically conductive surface 11 to limit penetration of the electrically conductive surface into the tissue surface (col. 3, ln. 34-55 and Figs. 1a-b).

Regarding claims 20 and 21, see the preceding rejection of claim 1.

Regarding claim 22, Irion further discloses that the electrically conductive surface 11 has a first surface area, the non-conductive surface 12 has a second surface area, and the first surface area is smaller than the second surface area (col. 2, ln. 30-35 and Fig. 1b).

Regarding claim 23, Lennox further discloses that the head 14 comprises an electrode and the electrode includes the electrically conductive surface (col. 5, ln. 50-60).

Regarding claim 31, see the preceding rejection of claim 18. In addition, it would have required only routine skill in the art to make the trapezoidal head shape taught by

Grossi to be parallelepiped since applicant has not disclosed any criticality or unexpected result associated with this specific shape.

Also, it would have been an obvious matter of design choice to make the head of Lennox of whatever form or shape was desired or expedient. A change in form or shape is generally recognized as being within the level of ordinary skill in the art, absent any showing of unexpected results. *In re Dailey et al.*, 149 USPQ 47.

Regarding claim 32, Lennox further discloses a sheath 28, 101 coupled to the shaft and moveable to at least partially cover the flexible portion and the head (col. 6, ln. 11-15 and Figs. 1a and 12).

Regarding claim 33, Lennox discloses a method of performing electrosurgery comprising:

positioning an electrically conductive surface of a head 14 of an instrument adjacent to a tissue surface, the head being pivotable relative to a shaft 20 of the instrument (col. 5, ln. 61-63, col. 7, ln. 12-18, and Figs. 1 and 5-7); and

moving the shaft relative to the tissue surface with the head pivoting such that the electrically conductive surface is oriented substantially parallel to the tissue surface (Figs. 5-10).

See the preceding rejection of claim 1 regarding the other limitations.

Regarding claim 34, Lennox further discloses the step of biasing the electrically conductive surface towards the tissue using a flexible portion 46 of the instrument (col. 5, ln. 61-63, col. 7, ln. 12-18, and Figs. 1 and 5-7).

Regarding claim 35, 37, and 38, see the preceding rejection of claim 33.

Regarding claims 40, 41, and 45, see the preceding rejections of claims 33 and 34 and Figs. 5-7 of Lennox.

Regarding claim 43, see the rejections of claims 1 and 40.

Regarding claim 44, see the rejection of claim 43 and Fig. 1b of Irion.

Regarding claim 46, see the preceding rejection of claim 1.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Lennox ('191) in view of Irion (U.S. Pat. No. 6,251,108 B1) and further in view of Rosar (U.S. Pat. No. 5,300,068).

Regarding claim 2, the claim differs from Lennox in calling for the flexible portion to comprise a nitinol wire. Lennox discloses that coagulating electrode head 14 has wire leads to connect the electrode to power source 21 (col. 6, ln. 4-6 and Fig. 1). These wire leads must be inherently flexible since they pass through the flexible portion 46 (Figs. 2 and 5-7). Rosar teaches an electrosurgical instrument, wherein a flexible wire lead 302 comprises nitinol (col. 9, ln. 54-66). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have made the wire leads of Lennox (and therefore, the flexible portion) comprise nitinol in view of the teaching of Rosar as an obvious material that is well-known in the art for making flexible wire leads.

Claim 24 is rejected under 35 U.S.C. 103(a) as being unpatentable over Lennox (U.S. Pat. No. 5,919,191) in view of Irion (U.S. Pat. No. 6,251,108 B1) and further in view of Nardella (U.S. Pat. No. 5,925,040).

Regarding claim 24, the claim differs from Lennox in view of Irion in calling for the electrode to have a T-shape. Nardella, however, teaches an analogous electrode roller with conductive 194 and non-conductive 198 surfaces (Fig. 9). Nardella further teaches that the shape of the conductive portions 194 can be varied to in size and shape to increase the conductive surface area of the electrode (col. 8, ln. 3-12). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to make the electrodes 11 of Lennox in view of Irion to have a T-shape in view of the teaching of Nardella in order to increase the conductive surface area of the electrode. Further, since applicant has not disclosed any criticality or unexpected result associated with this shape, the examiner maintains that it would have required only routine skill in the art to select a T-shape for the electrode.

Also, it would have been an obvious matter of design choice to make the electrodes 11 of Lennox in view of Irion of whatever form or shape was desired or expedient. A change in form or shape is generally recognized as being within the level of ordinary skill in the art, absent any showing of unexpected results. *In re Dailey et al.*, 149 USPQ 47.

Response to Arguments

Applicant's arguments have been fully considered but they are not persuasive.

Regarding the independent claims, applicant argues that Irion teaches away from using electrodes having projections or recesses. In response to this argument, the examiner maintains that although Irion's invention may disclose a smooth surface as

Art Unit: 3739

advantageous, the reference still provides the independent teaching that it is well known in the art to make an electrically conductive surface either recessed in or projecting from a surface. This teaching stands alone from the intentions of Irion's invention. Therefore, regardless of whether or not Irion would have wanted to provide projections or recesses, it would have been obvious to one of ordinary skill in the art to provide projections or recesses, based on what Irion teaches was known in the art as a whole at the time the invention was made.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Alex B. Toy whose telephone number is (571) 272-1953. The examiner can normally be reached on Monday through Friday, 8:00 AM to 4:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Linda C.M. Dvorak can be reached on (571) 272-4764. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
